

Q1/1 EMG – myopathies versus neuropathies

Interactive seminar - neurosciences

2_of 40+

Interactive seminar - neurosciences

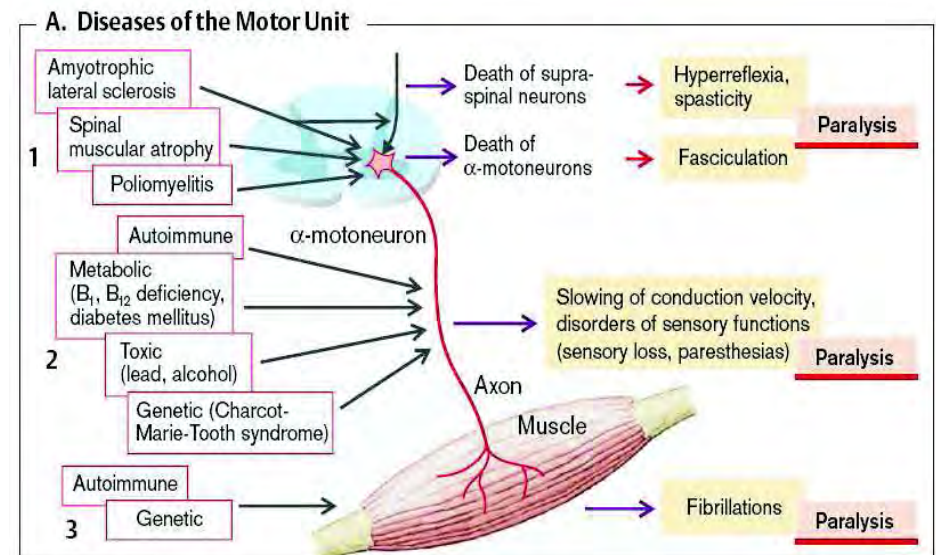

1_of 40+

Q1/2 Neuropathies versus myopathies

Clinical findings	Neuropathy	Myopathy
Muscle weakness	++	++
Loss of reflexes	+	0
Fasciculations (twitchings)	+	0
Sensory deficit	+	0
Abnormal reflexes (Babinski)	+	0

3_of 40+

Q2/1 Lower motoneuron disorders

4_of 40+

Q2/2 Upper motoneuron disorders

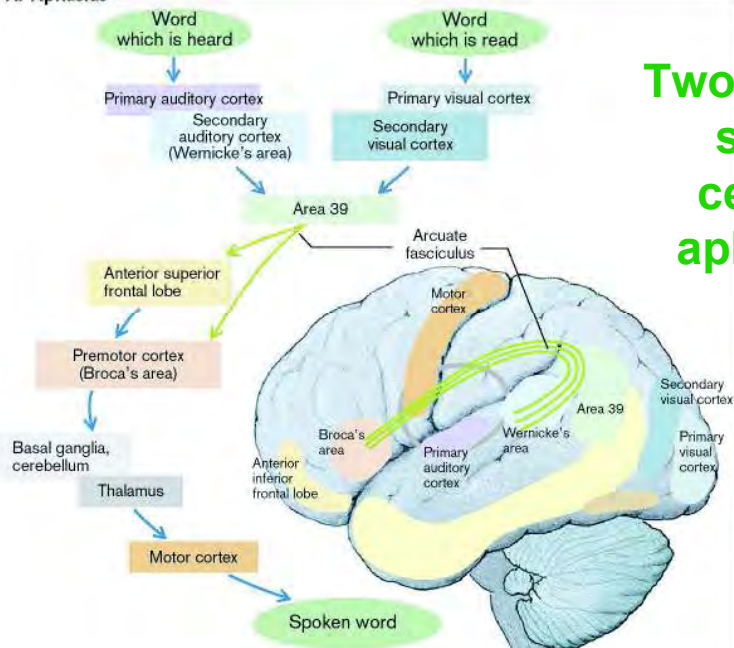

causes:
brain stroke,
tumor, infection,
demyelination

Q 3 Tremor

- A. Aphasia

Q 4/1 Two major speech centers, aphasias

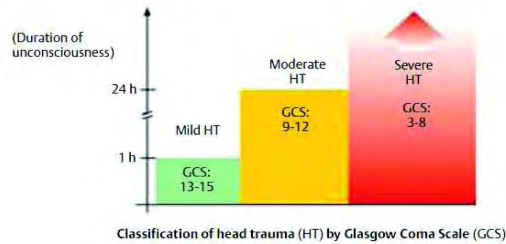

Type	Spontaneous speech	Repetition of words	Language comprehension	Finding words
Broca's aphasia	abnormal	abnormal	normal	impaired
Wernicke's aphasia	fluent (at times logorrhea, paraphasia, neologisms)	abnormal	impaired	impaired
Conduction aphasia	fluent, but paraphasic	markedly impaired	normal	abnormal, paraphasic
Global aphasia	abnormal	abnormal	abnormal	abnormal
Anomic aphasia	fluent	normal, but anomic	normal	impaired
Achromatic aphasia	fluent	normal, but anomic	normal	impaired
Motor transcortical aphasia	abnormal	normal	normal	abnormal
Sensory transcortical aphasia	fluent	fluent	abnormal	abnormal
Subcortical aphasia	fluent	normal	abnormal (transient)	abnormal (transient)

Q 4/2, speech centers, aphasias

Q 5 Intracranial hemorrhage

Traumatic intracranial hematoma

Q 8/1 Acute carbon-monoxide poisoning

Concentration	Symptoms
35 ppm (0.0035%)	Headache and dizziness within six to eight hours of constant exposure
100 ppm (0.01%)	Slight headache in two to three hours
200 ppm (0.02%)	Slight headache within two to three hours; loss of judgment
400 ppm (0.04%)	Frontal headache within one to two hours
800 ppm (0.08%)	Dizziness, nausea, and convulsions within 45 min; unconsciousness within 2 hours
1,600 ppm (0.16%)	Headache, tachycardia, dizziness, and nausea within 20 min; death in less than 2 hours
3,200 ppm (0.32%)	Headache, dizziness and nausea in five to ten minutes. Death within 30 minutes.
6,400 ppm (0.64%)	Headache and dizziness in one to two minutes. Convulsions, respiratory arrest, and death in less than 20 minutes.
12,800 ppm (1.28%)	Unconsciousness after 2-3 breaths. Death in less than three minutes.

Q 10/1

Disorders of Neuromuscular transmission

16_of 40+

Q 10/2

Disorders of Neuromuscular transmission

17_of 40+

Q 9 poly-radiculo-neuritis Guillain-Barre

- acute inflammatory demyelinating polyneuropathy
- disorder of the peripheral nerves
- attack of the myelin sheath of nerves by antibodies or white blood cells
- rapid onset of ascending paralysis
- begins with weakness and/or abnormal sensations of the legs and arms
- breathing muscles may be so weakened
- following gastrointestinal or respiratory viral infections

18_of 40+

Q 11 Artificial ventilation/ Iron lung

Ventilation can be delivered via:

- Hand-controlled ventilation such as: Bag-Valve-Mask Resuscitator Continuous-flow or Anaesthesia (or T-piece) bag
- A mechanical ventilator.
- Iron lung is a historical type of mechanical ventilator

AGE – advanced glycation end products

20_of 40+

Q 13/1 Visual field defects - scotomas

21_of 40+

Q 13/2 Functional classification of vision impairment

- 1 normal vision 6/6
- 2 low vision worse than (<) 6/18
(on the best eye with corrective lenses)
- 3 (practical) blindness < 3/60
or narrowing of visual angle less than < $10^{\circ} \times 10^{\circ}$
other norm < 6/60, < $20^{\circ} \times 20^{\circ}$
- 4 *amblyopia*

22_of 40+

Q 13/3 Causes of blindness

A ordered by frequency in the developed countries:

- 1 diabetes: retinopathy, 2 glaucoma, 3 senilní poruchy,
- 4 injuries, 5 others

B ordered by frequency in the third world countries:

- 1 trachoma (chlamydia trachomatis), 2 onchocercosis (onchocerca volvulus),
- 3 xeroftalmia (vit. A avitaminosis), 4 cataract, 5 glaucoma,
- 6 injuries, 7 senile macular degeneration, 8 diabetic retinopathy
- 9 genetic causes, 10 neurologic causes

C overall incidence:

- developed countries 0,2 %, worldwide 1 %,
- some third world countries several %

Q 14/1 Conduction: through air and bone Hearing loss: A. conductive, B. sensorineural

24_of 40+

Q 14/2 Hearing loss: A. conductive, B. sensorineural

Silbernagl/Lang, Color Atlas of Pathophysiology © 2000 Thieme

25_of 40+

Q 14/3 Pitchfork tests

Test	Principle	Norm	Conductive	Sensory-neural
Weber	PF on the vertex of the head	Non-lateral	Lateral to blocked side	Lateral to healthy side
Rinne	First on bone, then in the air	Positive	Indifferent	Positive
Schwabach	(subjective) Patient compared to examiner	Normal	Longer	Shorter

26_of 40+

Q 14/4 Functional classification of hearing loss

(measured without hearing aid)

1 normal hearing (threshold about 4 phon)

2 hardness of hearing

(hearing aid may be indicated:

at the band 500 Hz - 2 kHz bilaterally

threshold rise of 35 - 40 dB,

speech audiometry –threshold rise of more than 35 dB

low comprehension of loud speech at less than 4 m)

3 (practical) deafness

(does not hear loud voice at the ear, own voice,

threshold rise of 75 - 80 dB)

4 deaf-and-dumbness

(speech was not rehabilitated after inborn deafness)

27_of 40+

Q 14/5 Causes of hearing loss

- otosclerosis (in 0,5 - 1 % of elderly)
- conductive disorders
- hereditary and inborn disorders
- toxic damage
- meningoencephalitis
- professional damage
- presbyakusia
- Menier's disease

28_of 40+

Q 15/1 Acoustic neurinoma

Acoustic neurinoma

Represents about 8% of all intracranial tumors. It arises from the Schwann cells which invest the eighth nerve as it enters the internal auditory canal. 95% of these lesions originate within the auditory canal, and the other 5% arise from the nerve at its cerebellopontine angle course, proximal to the canal. Often bilateral in neurofibromatosis. Most acoustic neuromas arise from the superior vestibular branch of the eighth cranial nerve. The most noticeable radiographic change caused by these tumors is erosion of the superior and posterior lips of the porus acusticus.

Peritumoral edema can be seen in 30–35% of cases with larger lesions, and less frequently calcification, cystic change, and hemorrhage

29_of 40+

Q 16 Acute otitis media

Children younger than seven are much more prone to otitis media due to shorter Eustachian tubes, which are at a more horizontal angle than in the adult ear. They also have not developed the same resistance to viruses and bacteria as adults.

Q 20/1 Vomiting center/ causes of vomiting

34_of 40+

Q 20/2 Causes of vomiting

- 1 Intracranial hypertension - irritation
- 2 Drugs – nicotine, apomorphine, etc
- 3 Kinetosis
- 4 Radiation disease
- 5 Pregnancy
- 6 Psychogenic
- 7 Pharyngeal irritation
- 8 Local gastric irritation – food poisoning
- 9 Peritoneal irritation, ileus
- 10 Other internal organs – heart etc

Q 21/1 Migraine - phosphenes

FIGURE 1. Photographic negative of a *migraine phosphene protocol*. The scintillating phosphene was progressing through the lower quadrant and part of the upper quadrant of the left visual hemifield. Thirteen drawings were made between 2 and 29 min after the phosphene appeared near the centre of the visual field. To evaluate the distance between the migraine phosphene and the centre of the visual field, several radii were drawn across the protocol. The angular distance from the fovea centre, computed in degrees of visual angle, is indicated by circles. Circles and radii were added to the protocol sheet after the observations were made. Observation distance, 34 cm.

6 min

36_of 40+

FIGURE 4. Illustration of a scintillating migraine phosphene and its trailing scotoma observed on a dynamic random-dot noise pattern (TV screen without program). The scotoma is perceived as a homogeneous neutral grey. Some of the phosphene particles (dotted) appeared in a pure red or green colour, some in deep black (Grüsser & Landis, 1991).

Q 21/2 Migraine - scotoma

37_of 40+

Q 22 Glasgow coma scale

		Glasgow Coma Scale					
		1	2	3	4	5	6
Eyes	Does not open eyes	Opens eyes in response to painful stimuli	Opens eyes in response to voice	Opens eyes spontaneously	N/A	N/A	
Verbal	Makes no sounds	Incomprehensible sounds	Utters inappropriate words	Confused, disoriented	Oriented, converses normally	N/A	
Motor	Makes no movements	Extension to painful stimuli (decerebrate response)	Abnormal flexion to painful stimuli (decorticate response)	Flexion / Withdrawal to painful stimuli	Localizes painful stimuli	Obeys commands	

The scale comprises three tests: [eye](#), [verbal](#) and [motor](#) responses. The three values separately as well as their sum are considered. The lowest possible GCS (the sum) is 3 (deep [coma](#) or [death](#)), while the highest is 15 (fully awake person).

Q 23 Spinal shock in man

Phase	Time	Physical exam finding	Underlying physiological event
1	0-1d	Areflexia/Hyporeflexia	Loss of descending facilitation
2	1-3d	Initial reflex return	Denervation supersensitivity
3	1-4w	Hyperreflexia (initial)	Axon-supported synapse growth
4	1-12m	Hyperreflexia, Spasticity	Soma-supported synapse growth

In both **meningeal irritation** and **spinal shock** **extensor systems** take over **flexor systems**

Decerebration

Q 25 Criteria for cerebral death

TABLE 52-2. Criteria for Cerebral Death (Brain Death)

Prerequisite: All appropriate diagnostic and therapeutic procedures have been performed

Criteria (to be present for 30 minutes at least 6 hours after the onset of coma and apnea):

1. Coma with cerebral unresponsivity (see definition 1)
2. Apnea (see definition 2)
3. Dilated pupils
4. Absent cephalic reflexes (see definition 3)
5. Electrocerebral silence (see definition 4)

Confirmatory test: Absence of cerebral blood flow

Definitions

1. Cerebral unresponsivity—a state in which the patient does not respond purposively to externally applied stimuli, obeys no commands, and does not utter sounds spontaneously or in response to a painful stimulus.
2. Apnea—the absence of spontaneous respiration, manifested by the need for controlled ventilation (that is, the patient makes no effort to override the respirator) for at least 15 minutes.
3. Cephalic reflexes—pupillary, corneal, oculoauditory, oculovestibular, oculocephalic, cilio-spinal, snout, pharyngeal, cough, and swallowing.
4. Electrocerebral silence—an EEG with an absence of electrical potentials of cerebral origin over 2 μ V from symmetrically placed electrode pairs over 10 cm apart and with interelectrode resistance between 100 and 10,000 Ω .

(Adapted from A Collaborative Study by Ninos, NIH, 1977.)
